

KAYA

Kaya mo 'to.

An AI budgeting copilot that turns impulse spending into on-chain savings, gasless payments, and real financial credibility — built on Stellar.

PRACTICAL PAYMENTS

MEANINGFUL DEFI

LOCALIZED TOOLS

COMPOSABILITY

Young Filipinos can spend in one tap — but can't save, can't buffer, can't borrow.

Impulse by default

E-wallets make spending frictionless and saving an afterthought. A ₱250 coffee, weekly, is the gap between a buffer and none.

No safety net

A large share of young Filipinos hold near-zero liquid savings. One emergency = high-interest debt.

Thin credit files

Banks have almost no data on a 22-year-old's discipline. Good behavior is invisible and unrewarded.

Passive savings

Even money that is saved just sits in a wallet earning nothing.

The gap: no tool closes the loop between behavior, productive assets, payments, and credibility. KAYA does — and Stellar is the rail that makes it possible.

Built for the segment fintech forgets.

Iskolar

THE STUDENT · 18–24

Allowance-based, tempted by food delivery & online sales, zero savings.

KAYA → Turns saved ₱250 coffees into a growing, yield-earning balance.

Yuppie

YOUNG PROFESSIONAL · 23–30

First real income, lifestyle creep, wants to save but lacks discipline.

KAYA → Automated cooling-off savings, gasless payments, and a credit reputation.

Negosyante

MICRO-MERCHANT (PEER)

Accepts QRPh, wants instant settlement.

KAYA → Receives the asset they want via Stellar path payments, instantly.

Primary market: Philippines · designed to extend across SEA by swapping in local anchors + stablecoins.

One continuous behavioral-financial loop.

Every stage is powered by an existing Stellar building block — composability first.

Fund in → AI coaches → **Save it (vault)** or **Pay it (QR)** → build reputation → unlock credit.

The “Delayed Gratification” Vault

“Save it Instead” — DeFi mechanics used to break the impulse cycle, not just farm yield.

USER STORY

Maya wants a ₦250 latte. KAYA flags it: she's over her “wants” budget. Instead of guilt, it offers a “Save it Instead” button. One tap moves ₦250 into her vault — earning micro-yield, locked for 48 hours so the craving passes.

HOW IT WORKS ON STELLAR

- Soroban smart contract (“KAYA Vault”) accepts local-stablecoin deposits
- Idle funds routed into an existing Stellar yield aggregator / liquidity pool
- The twist: a 48-hour cooling-off lockup enforced per deposit

WHY IT JUDGES WELL DeFi with a genuine human purpose, tied to a real asset and a real local problem — not yield for yield's sake.

Composability: Soroban contract + third-party yield pool + anchor-issued stablecoin, stitched into one feature.

Native KAYA Wallet Funding & Cash-Out

Move pesos in and out using rails people already trust.

USER STORY

Carlo links GCash, taps “Add ₱1,000,” confirms in the familiar flow, and seconds later sees ₱1,000 spendable in KAYA. “Cash Out” returns pesos to his bank or e-wallet.

HOW IT WORKS ON STELLAR

- SEP-24 (hosted) + SEP-6 (programmatic) against existing SEA anchors
- Deposit via GCash, Maya, bank → anchor issues local stablecoin to the wallet
- SEP-10 wallet auth + SEP-12 KYC handoff (KAYA never custodies IDs)

WHY IT JUDGES WELL The clearest proof of “build on existing rails, not your own gateway.” We explicitly consume anchor infrastructure.

Composability: Zero payment-gateway code — KAYA is a thin, friendly client over standardized anchor SEPs.

"Kaya Afford It? Pay It!" QR Payments

AI green-lights the buy → scan → paid in pesos, gaslessly.

USER STORY

The AI approves Maya's groceries — "Kaya mo 'to!" A "Pay Now" button appears. She scans the store's QRPh code and the exact amount is paid. She never thinks about crypto, gas, or conversion.

HOW IT WORKS ON STELLAR

- QR scanner compatible with QRPh / regional EMVCo standards
- Stellar path payment converts her stablecoin to the merchant's asset atomically
- Fee-bump (sponsored fees): KAYA's backend pays the XLM fee → fully gasless

WHY IT JUDGES WELL A real purchase, at a real merchant, on a real local QR standard — UX indistinguishable from GCash.

Composability: Uses Stellar's native DEX/AMM for conversion + built-in fee-bump for gasless UX. No custom relayer.

On-Chain Financial Health Score

Turn proven discipline into real borrowing power.

USER STORY

After months of hitting goals and respecting cooling-off periods, Carlo has a verifiable KAYA Score. When a Stellar micro-lender later offers a low-collateral loan, it's because it could read his track record on-chain.

HOW IT WORKS ON STELLAR

- Good habits recorded as on-chain attestations / Soroban reputation registry
- The score is a portable, user-controlled Web3 primitive
- Other Stellar micro-lenders read it to grant under-collateralized loans

WHY IT JUDGES WELL Extends a simple "health score" into durable, ecosystem-wide utility — exactly what composability unlocks.

Composability: Designed to be consumed by others — KAYA becomes a building block in the wider Stellar credit stack.

Thin, opinionated client over existing Stellar rails.

CLIENT

KAYA Mobile App

React Native / Flutter

AI Budgeting Engine

"Kaya afford it?" coach

Stellar Wallet

Freighter / Passkey

BACKEND

KAYA Backend + Fee-Bump Service

Orchestrates AI · Stellar SDK · sponsors network fees (gasless UX)

STELLAR

Local Anchor

SEP-24 / SEP-6
GCash · Maya · Bank

Horizon / Soroban RPC

Soroban Vault

48h lockup + yield

Path Payment

→ QR merchant

Reputation Registry

on-chain score

We build the thin layer. We reuse the heavy lifting.

WE BUILD

- AI coaching layer (the “Kaya afford it?” moment)
- Cooling-off vault contract logic (48h lockup)
- Reputation registry schema
- Consumer UX that feels like a normal peso wallet

WE REUSE

- On/off-ramps → existing SEA Stellar anchors (SEP-24/6)
- DeFi & liquidity → yield pools + Stellar native DEX/AMM
- Payments → path payments + fee-bump
- Wallets & identity → Freightier/passkey + attestations

RECOMMENDED INTEGRATIONS — ALL COVERED

ON/OFF-RAMPS

DEFI & LIQUIDITY

PAYMENTS & DISBURSEMENTS

WALLETS & IDENTITY

“Plug into existing wallets, DeFi protocols, and on/off-ramps — don't reinvent the wheel.” KAYA does exactly that.

Every requirement in the brief — checked.

User-facing financial app for real people

Mobile money coach for young Filipinos

Meaningful DeFi using real assets

Soroban yield vault + 48h cooling-off lockup

Integrate with local anchors

SEP-24/SEP-6 against SEA anchors

Composability — reuse building blocks

Anchors, yield pools, DEX/AMM, fee-bump, wallets

Practical payment app (everyday use)

AI-approved QRPh pay, gasless via fee-bump

Localized tool / local economy

GCash/Maya/bank ramps + PHP stablecoin

Give assets utility (earn/swap/disburse)

Vault yield · path-payment swap · QR pay & cash-out

Wallets & identity

Freighter/passkey + on-chain reputation score

Aligned to the program timeline.
